LAB-15.5

Name: P.Sai Bunny

Hall.No:2303A51911

Batch - 12

Task 1 – Student Attendance API

Task:

Create a RESTful API for student attendance tracking.

Instructions:

- Endpoints required:
 - o GET /attendance → View attendance records
 - o POST /attendance → Mark attendance
 - o PUT /attendance/{id} → Update attendance record
 - o DELETE /attendance/{id} → Remove attendance entry
- Ensure JSON-based request and response handling.

Expected Output:

- API for maintaining and updating attendance records.

PROMPT:

"""Generate a Python Flask REST API for student attendance with in-memory storage.

Implement GET /attendance, POST /attendance, PUT /attendance/<id>, DELETE /attendance/<id>.

Use JSON request/response and add comments."""

GIVEN CODE:

```

lab15.py > create_attendance
1  """Generate a Python Flask REST API for student attendance with in-memory storage.
2  Implement GET /attendance, POST /attendance, PUT /attendance/<id>, DELETE /attendance/<id>.
3  Use JSON request/response and add comments."""
4  from flask import Flask, request, jsonify
5  app = Flask(__name__)
6  # In-memory storage for attendance records
7  attendance_records = []
8  # GET /attendance - Retrieve all attendance records
9  @app.route('/attendance', methods=['GET'])
10 def get_attendance():
11     return jsonify(attendance_records), 200
12 # POST /attendance - Create a new attendance record
13 @app.route('/attendance', methods=['POST'])
14 def create_attendance():
15     data = request.get_json()
16     if not data or 'student_name' not in data or 'date' not in data:
17         return jsonify({'error': 'Invalid input'}), 400
18     new_record = {}
19     'id': len(attendance_records) + 1,
20     'student_name': data['student_name'],
21     'date': data['date']
22 }
23 attendance_records.append(new_record)
24 return jsonify(new_record), 201
25 # PUT /attendance/<id> - Update an existing attendance record
26 @app.route('/attendance/<int:record_id>', methods=['PUT'])
27 def update_attendance(record_id):
28     data = request.get_json()
29     if not data or 'student_name' not in data or 'date' not in data:
30         return jsonify({'error': 'Invalid input'}), 400
31     for record in attendance_records:
32         if record['id'] == record_id:
33             record['student_name'] = data['student_name']
34             record['date'] = data['date']
35             return jsonify(record), 200
36     return jsonify({'error': 'Record not found'}), 404
37 # DELETE /attendance/<id> - Delete an attendance record
38 @app.route('/attendance/<int:record_id>', methods=['DELETE'])
39 def delete_attendance(record_id):
40     global attendance_records
41     attendance_records = [record for record in attendance_records if record['id'] != record_id]
42     return jsonify({'message': 'Record deleted'}), 200
43 if __name__ == '__main__':
44     app.run(debug=True)
45

```

Task 2 – Inventory Management API

Task:

Develop a REST API for warehouse inventory management.

Instructions:

- Endpoints required:
 - o GET /inventory → List all items
 - o POST /inventory → Add new item
 - o PUT /inventory/{id} → Update stock quantity
 - o DELETE /inventory/{id} → Remove an item
- Implement validation for stock values.

Expected Output:

- API capable of managing inventory stock levels.

PROMPT:

"""Create a Flask REST API for inventory management with item id, name, and quantity.

Implement GET, POST, PUT, DELETE endpoints for /inventory.

Add validation so stock quantity cannot be negative."""

GIVEN CODE AND OUTPUT:

```
lab15.py / ...
1  """Create a Flask REST API for inventory management with item id, name, and quantity.
2  Implement GET, POST, PUT, DELETE endpoints for /inventory.
3  Add validation so stock quantity cannot be negative."""
4  from flask import Flask, request, jsonify
5  app = Flask(__name__)
6  # In-memory storage for inventory items
7  inventory = {}
8  @app.route('/inventory', methods=['GET'])
9  def get_inventory():
10     """Endpoint to retrieve the entire inventory."""
11     return jsonify(inventory)
12  @app.route('/inventory', methods=['POST'])
13  def add_item():
14     """Endpoint to add a new item to the inventory."""
15     data = request.get_json()
16     item_id = data.get('id')
17     name = data.get('name')
18     quantity = data.get('quantity')
19
20     # Validate input
21     if not isinstance(item_id, int) or not isinstance(name, str) or not isinstance(quantity, int):
22         return jsonify({"error": "Invalid input: id must be an integer, name must be a string, and quantity must be an integer."}), 400
23     if quantity < 0:
24         return jsonify({"error": "Invalid input: quantity cannot be negative."}), 400
25
26     # Add item to inventory
27     inventory[item_id] = {"name": name, "quantity": quantity}
28     return jsonify({"message": "Item added successfully."}), 201
29  @app.route('/inventory/<int:item_id>', methods=['PUT'])
30  def update_item(item_id):
31     """Endpoint to update an existing item in the inventory."""
32     if item_id not in inventory:
33         return jsonify({"error": "Item not found."}), 404
34
35     data = request.get_json()
36     name = data.get('name')
37     quantity = data.get('quantity')
38
39     # Validate input
40     if name is not None and not isinstance(name, str):
        ...

Task 3 – Hotel Room Booking API

Task:

Develop a RESTful API for hotel room booking.

Instructions:

- Endpoints required:

- o GET /rooms → View available rooms
- o POST /rooms/book → Book a room
- o GET /rooms/{id} → View booking details
- o DELETE /rooms/{id} → Cancel booking
- Implement error handling for unavailable rooms.

Expected Output:

- API simulating hotel room booking operations.

PROMPT:

"""Generate a Flask REST API for hotel room booking using in-memory data.

Endpoints: GET /rooms, POST /rooms/book, GET /rooms/<id>, DELETE /rooms/<id>.

Add error handling if a room is already booked."""

GIVEN OUTPUT:

```

1  """Generate a Flask REST API for hotel room booking using in-memory data.
2  Endpoints: GET /rooms, POST /rooms/book, GET /rooms/<id>, DELETE /rooms/<id>.
3  Add error handling if a room is already booked."""

Task 4 – Online Voting API

Task:

Create a RESTful API for an online voting system.

Instructions:

- Endpoints required:
 - o GET /candidates → List candidates
 - o POST /vote → Cast a vote
 - o GET /results → View voting results
- Ensure one vote per user using in-memory validation.

Expected Output:

- API simulating a secure online voting process.

PROMPT:

"""Create a Flask REST API for an online voting system.

Endpoints: GET /candidates, POST /vote, GET /results.

Ensure each user can vote only once using in-memory validation."""

GIVEN OUTPUT:

```
lab15.py > ...
1 """Create a Flask REST API for an online voting system.
2 Endpoints: GET /candidates, POST /vote, GET /results.
3 Ensure each user can vote only once using in-memory validation."""

Task 5 – Teacher Management API

Task:

Develop a RESTful API to manage teacher records.

Instructions:

- Endpoints required:
 - o GET /teachers → List all teachers

- o POST /teachers → Add a new teacher
- o PUT /teachers/{id} → Update teacher details
- o DELETE /teachers/{id} → Remove a teacher
- Ensure proper error handling and JSON responses.

Expected Output:

- Functional API for managing teacher information.

PROMPT:

""Generate a Flask REST API to manage teachers with id, name, and subject.
Implement GET, POST, PUT, DELETE endpoints for /teachers.
Return JSON responses and handle errors properly.""

GIVEN OUTPUT:

```

```

Explanation: In this lab, we created different REST APIs using Flask with the help of AI. We implemented CRUD operations for attendance, inventory, hotel booking, voting system, and teacher management. Each API uses JSON for data handling and includes proper validation and error handling. We also learned how to design endpoints and manage data using in-memory storage. Overall, this lab helped us understand backend development and how AI makes coding faster and easier.
